

A Natural Based Program

The Sanctuary's Life and Synergy products provide nutrients for the turf and nutritional energy for soil microbial populations. When used as part of a turf management program, these products and enhance turf quality and help balance the biological and chemical functions of the soil.

Maintenance Programs

Life and Synergy products can be applied regularly throughout the season. This approach improves overall nutrient efficiency while supplying a food source to the microbial populations that can be reduced by poor quality soil, frequent applications of pest control products, or weather related stress problems. Application rates range from .2 to .4 lbs of nitrogen per 1,000 square feet.

Corrective Programs

Life and Synergy products can be applied at higher rates to correct biological and nutrient deficiencies. These programs are best timed in conjunction with soil aeration, as a dormant feed, or during renovation. Application rates range from .8 to 1.0 lbs of nitrogen per 1000 square feet.

Water

We realize that nothing can survive without water. We also know that overwatering can cause serious damage to your lawn, create problem runoff, and cost you money. With this knowledge we will work with you and your sprinkler system the way that no other lawn care company can, to give you a holistic approach to maintaining your lawn.

Core Aerification

The biggest benefit to aerating your lawn is allow sufficient oxygen to reach the grass roots. Heavy soil compaction severely reduces the pore space around grass roots which limits the amount of oxygen in that region. Roots require oxygen to grow and absorb water and nutrients.

Core aerification is an important and highly recommended practice for many lawns. This process is used to reduce soil compaction and thatch, improve surface drainage, and improve conditions prior to overseeding.

Overseeding

If your lawn has problem areas of thin grass, or if you have multiple varieties of grass that you would like to have a uniform appearance, overseeding might be the answer for you. We can pick for a multitude of different grass seed varieties that will transform your yard into a lush, green oasis.

The Sprinklerman *RESULTS* Program

April 15th to May 15th

Spring Start up of Irrigation System

April 15th to May 1st

1st application of fertilizer (with crabgrass control)

June 12th to July 26th

2nd application of fertilizer

July 20th to August 20th

Mid Season Checkup for irrigation

July 31st to August 14th

3rd Application of fertilizer

August 1st –October 1st

Core Aeration and or Overseeding (if needed)

September 18th to October 9th

4th application of fertilizer

October 1st to October 31st

Irrigation system Winterization

spot spraying of broadleaf weed control will be used as necessary
